## Acciaierie Venete Introduces LUMEN: Steel Produced Using 100% Renewable Electricity

Acciaierie Venete is pleased to announce the availability of steel produced with the use of **100% renewable electricity** for the product range manufactured at its Padua facility.

We have named this new generation of steel **LUMEN**: an identity that casts light on our present and future sustainability journey, defined by clear and ambitious objectives.

LUMEN embodies ever more responsible production: a choice that reduces environmental impact through the exclusive use of energy from renewable sources. It is a transparent solution that contributes tangibly to the reduction of greenhouse gas emissions.

Available on request at an additional **€13 per ton** for the current year, this new offer will enable the elimination of the associated **Scope 2** emissions and, consequently, further improve the carbon footprint of our steels, while maintaining the usual product reliability standards unchanged.

Beyond representing a concrete commitment to the progressive reduction of our carbon footprint, in line with the [Decarbonization Plan](#), the initiative aims to meet the growing and immediate needs of our customers, partners, and the downstream value chain.

LUMEN also fits within the broader scope of **Steelnovo**, which for Acciaierie Venete symbolizes the adoption of a business strategy integrating ESG principles, in full respect of the environment and the communities with which we work.

For further information, please contact the Sales Department.
